

Change log

Sprint 9

The diagram was created at `Sprint9`
User can register his visitor account without logging out and possibly losing his data and session, this provides the user with a UUID, where it can be used as input at the 'username' field to log in.

- Reflected logic of visitor reg with the password hashing
- If the user exists (by email, uuid, or username): returns 201 with their tokens and data.
- If the user does not exist: creates them, sends PIN, and returns onboarding tokens and empty data.
- Password is optional in this flow.
